

# Signet's Own Spot Marking Spray Quality Analysis

Signet's Own Spot Marking Spray is manufactured in Australia by Signet in our custom built manufacturing facility. Each batch is made to the highest quality standards and tested in our NATA accredited laboratory to assure adherence to our strict quality specifications. This guide will detail the quality features of Signet's Own Spot Marking Spray compared to other products in the market.

## Superior Settling Score

The settling scale describes the amount of heavy particles that have settled on the bottom of the can. A lower score means more settling and a harder, drier settle that cannot be reincorporated. A higher score means less settling with any settling that does occur being easily reincorporated by shaking the can. Signet's Own Spot Marking Spray scores between 8 and 9 on this scale. Our tests show the minimal amount of settle that does occur over time is always a soft settle that is easily reincorporated by the glass marble in the can when the can is shaken before use. This score is the result of years of fine tuning our formula and the use of the most advanced anti-settling technology in the world to ensure our paint maintains its composition while in storage. All competitor products tested had a score of 6 or less with many having scores between 1-3 where the settle was hard and could not be reincorporated. This would inevitably result in some blockages occurring during use, something that is very rare with Signet's Own Spot Marking Spray.

## Paint Product Weight to Propellant Weight Ratio

Signet uses a consistent paint to propellant ratio of 250 grams of paint and 100 grams of propellant for each can of Signet's Own Spot Marking Spray. This ensures value for money with each can. Extensive testing conducted by Signet has shown most other brands pack between 210-240 grams of paint with the remaining 140-110 grams being made up of propellant. More paint in your Signet's Own Spot Marking Spray means more marks for your money.

## Volume of Paint

Signet's Own spot marking paint is formulated to spray every time and not settle during storage. We have spent years perfecting our formulas and after extensive testing we are confident we are giving our customers the most volume of paint in the market. Each can of Signet's Own spot marking paint contains approximately 260ml volume of paint. Other products in the market will often thicken their product up with cheap extender pigments and chalk. This increases the weight of the product but reduces the actual volume of paint the customer receives. Competitor's products range from as little as 180ml to 240ml for our nearest competitor. Again, the higher volume of paint you get in a can of Signet's Own Spot Marking Spray means better value and more marks out of each and every can.

## Ease of Use

The quality features built into the formulations of Signet's Own Spot Marking Spray are all designed to make the product easy to use and provide superior value for money for our customers. Our consistent viscosity and lack of settling ensure that when shaken for 30 seconds before use, and cleared after use, Signet's Own Spot Marking Spray will not block. Our trigger cap provides a consistent spray suitable for writing or marking lines of any size and shape. Signet's high quality formulas use the best pigments available to ensure our marks are weather and abrasion resistant enough to see your job through ever time.
